DOI:

Three varieties namely *Thevetia peruviana* L. and *Catharanthus roseus* var. *roseus* have been studied for chromosome number, chromosomal associations, chiasma frequencies, size of tetrads and pollen grains and pollen viability. In all the four plant types, the chromosomal number remains more or less same (2n=16-22). Both bivalents and univalent have been observed in three varieties of *T. peruviana* specially ring association. But in *C. roseus*, rod association is in higher frequency. Linear type of tetrads have not been found in three varieties of *T. peruviana* but interestingly it is observed in *C. roseus*. The shape of viable pollen grains is quite similar in all four plant types.

Key words: *Thevetia peruviana*, *Catharanthus roseus*, chromosome number, chromosomal association, chiasma frequencies and plant species.

MATERIAL AND METHODOLOGY

Phenological studies of both plant indicate that the blooming throughout the year. Flower buds of different sizes were collected from the selected plants species during their flowering seasons, at the relative temperature and humidity appropriate size of bud was taken. They were fixed in Carnoy's fluid I for 24 hrs, and then transferred to 70% alcohol for storage. Their anthers were put on the slide and stained in 1% aceto-carmine solution. A cover slip was placed over the solution.

After pressing and heating different pollen mother cell (PMC's) were seen with different meiotic stages. Microphotography was done from temporary prepared slides at different magnifications ($\times 100$ - $\times 450 \mu\text{m}$).

RESULT AND DISCUSSION

Observations about cytological characters have been presented in Table 1, Fig. 1-7. Normal meiotic division was observed in all the selected species. Orange, yellow and white varieties of *T. peruviana* and *C. roseus* were studied for their chromosome number, chromosomal association, chiasma frequency. The chromosome number of three varieties of

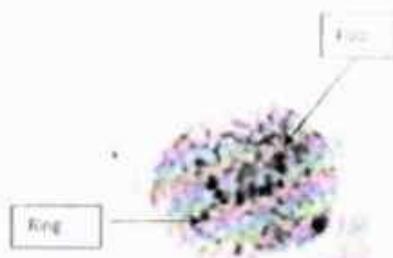

Thevetia peruviana

Thevetia were $2n=20$. However chromosome number differ in *C. roseus* $2n=16$. Both bivalents (ring and rods) and univalent have been observed in all above said plant types. General ring association occur in three varieties of *T. peruviana*. Rod association were observed in higher frequency in *C. roseus*. Chiasma frequency per chromosome is quite

low in *C. roseus* and it remains least affected in all the three varieties of *T. peruviana*. Laan and Arends (1985) also arrived at similar conclusion from their cytological studies in many genera of family Apocynaceae. They observed basic number of $X=6, 8, 9, 10, 11, 12, 16, 20, 21$ and 23 . Out of these $X=11$ is primitive occurring in 60% of genera

Table 1: Data on chromosomal characteristics of three varieties of *Thevetia peruviana* L., *Catharanthus roseus* L.

S.No.	Character Plant spp.	Chromosome number	Chromosome association		Univalent (range/average)	Chiasma frequency/ Chromosome (range/average)
			Binotent [range/average]	Ring Rod		
1.	<i>Thevetia peruviana</i> L.					
	Var. orange	2n=20	2.6/3.8±0.413	3.6/4.1±0.452	2.4/2.8±0.307	11.1/13.5±0.554
	Var. yellow	2n=20	3.6/4.1±0.432	3.6/4.2±0.465	2.4/2.7±0.301	12.15/13.1±0.536
	Var. white	2n=20	3.6/4.4±0.480	2.5/4.0±0.423	2.3/2.2±0.298	11.14/12.6±0.575
2.	<i>Catharanthus roseus</i> L.	2n=16	2.4/2.8±0.310	3.5/4.2±0.467	0.8/2.0±0.273	8.13/9.8±0.513

**Graph 1:** Data on chiasma frequency of chromosome in three varieties of *T. peruviana* and *C. roseus*.

investigated by them. Santhosh and Omnakumari (1997) studied karyomorphology of two varieties of *T. peruviana*, yellow and white. They observed some differences in chromosome category and chromosome length; in contrast we have not observed any differences in chromosomal character in three varieties (orange, yellow and white) of *T. peruviana*. Sasikumar and Abraham, 1993, and Mendiore *et al.*, 2005, Rani and Kumar, 2011 observed 2n=16 as chromosome number in *C. roseus*. Our cytological studies also confirm their findings.

Roy Thapadar (2014) had studied cytotoxic work in Apocynaceae family. Goven *et al.* (2019) have been reported contribution the chromosome number and

phylogeny of Turkish *Vincetoxicum* Wolf of Apocynaceae. Two floral types of *Catharanthus roseus* L., viz. pink and white were studied through differential staining with orcein, CMA and DAPI for cytogenetical characterization and to assist towards updating their taxonomical status and evaluating chromosomal diversity between them (Data *et al.* 2020).

CONCLUSION

All the plant types are diploid in nature. Meiosis was quite normal in them. Univalent as well as bivalents are commonly distributed in selected plant types. There is no marked variation among the plants different localities of Jaipur. Therefore, it is inferred that above said plant types are almost ecologically well established locally.

The chromosomal data providing an important basis for future studies like cytogenetic mapping, genomics, TTA genetics and breeding programmes related to these important medicinal species.
